FOCUS ON OUR
CRITICAL ILLNESS
DEFINITIONS
This guide lists all of the definitions we cover, with a clear and simple definition for each.

</table>
What we cover

In this booklet you’ll find an A-Z of all our critical illness definitions, additional conditions and child specific conditions that are available with our Personal and Business Menu Plans. Depending on the options you choose you and your children may not be covered for all the definitions.

Critical illness definitions

Our critical illness definitions, plus Total Permanent Disability if included, pay the full amount you’re covered for.

Additional conditions

Our additional conditions pay 25% of the amount of cover up to a maximum of £25,000. And if you later meet one of our critical illness definitions, we would also pay the full amount you’re covered for. If you choose to include Enhanced Children’s Critical Illness Cover, we’ll cover certain pregnancy complications as an additional condition (£5,000 per affected pregnancy).

Child-specific conditions

If you choose to include Enhanced Children’s Critical Illness Cover, children from birth to age 21, or 23 if in full-time education, are covered for 13 child-specific conditions. These pay 50% of the cover amount up to £50,000.

All diagnoses have to be:

- Made by a consultant employed at a hospital within the countries listed on page 5, who is a specialist in an area of medicine appropriate to the cause of the claim.
- The first and unequivocal diagnosis of the critical illness.
- Confirmed by our chief medical officer.

We’ll pay a claim if you meet one of the critical illness or additional condition definitions listed in this booklet.
**Personal support whenever you need it**

During difficult times in your life – like when you’re seriously ill – you might need additional support beyond a financial payout.

Our Helping Hand service gives you access to a dedicated nurse who’ll provide tailored and personal support whenever you need it – for as long as you need it.

It’s available to use from the day your plan starts – not just when making a claim. It won’t cost you anything extra and your family (partner and children) can use it too.

Helping Hand is a package of support services, provided by third parties that aren’t regulated by the Financial Conduct Authority. These services aren’t part of our terms and conditions, so can be amended or withdrawn at any time.
We restrict Critical Illness Cover and Life or Critical Illness Cover claims to certain parts of the world.

This means if you’re living or working outside the UK and you need to make a claim, you might have to return to one of the following countries:

- UK
- Australia
- Austria
- Belgium
- Bulgaria
- Canada
- Channel Islands
- Cyprus
- Czech Republic
- Denmark
- Estonia
- Finland
- France
- Germany
- Gibraltar
- Greece
- Hong Kong
- Hungary
- Iceland
- Ireland
- Isle of Man
- Italy
- Japan
- Latvia
- Liechtenstein
- Lithuania
- Luxembourg
- Malta
- The Netherlands
- New Zealand
- Norway
- Poland
- Portugal
- Slovakia
- Slovenia
- South Africa
- Spain
- Sweden
- Switzerland
- USA
If you have Critical Illness Cover or Life or Critical Illness Cover, you will be covered for this list of conditions. You can choose whether to include total permanent disability.

- Aorta graft surgery – for disease or traumatic injury
- Aplastic anaemia – permanent
- Bacterial meningitis – resulting in permanent symptoms
- Benign brain or spinal cord tumour – resulting in permanent symptoms or specified treatment
- Blindness – permanent and irreversible
- Brain injury due to trauma, anoxia or hypoxia – resulting in permanent symptoms
- Cancer – excluding less advanced cases
- Cardiac arrest – with insertion of a defibrillator
- Cardiomyopathy – of specified severity or undergoing a defined treatment
- Cauda equina syndrome – with permanent symptoms
- Chronic lung disease – of specified severity
- Coma – with associated permanent symptoms
- Coronary artery bypass grafts
- Creutzfeldt-Jakob disease (CJD) – resulting in permanent symptoms
- Deafness – permanent and irreversible
- Dementia including Alzheimer’s disease – resulting in permanent symptoms
- Encephalitis – resulting in permanent symptoms
- Heart attack – of specified severity
- Heart failure – of specified severity
- Heart valve replacement or repair
- Intensive care – requiring mechanical ventilation for 10 consecutive days
- Kidney failure – requiring permanent dialysis
- Liver failure – irreversible
- Loss or removal of an eyeball – due to injury or disease
- Loss of hand or foot – permanent physical severance
- Loss of independent existence – resulting in permanent symptoms
- Loss of speech – permanent and irreversible
- Major organ transplant – from another donor
- Motor neurone disease and specified diseases of the motor neurones – resulting in permanent symptoms
- Multiple sclerosis – with past or present symptoms
- Neuromyelitis optica (Devic’s disease)
• Paralysis of limbs – total and irreversible
• Parkinson plus syndromes – resulting in permanent symptoms
• Parkinson’s disease – resulting in permanent symptoms
• Peripheral vascular disease – with bypass surgery
• Pneumonectomy – removal of a complete lung
• Pulmonary artery graft surgery
• Pulmonary hypertension – of specified severity
• Spinal stroke – of specified severity
• Stroke – of specified severity
• Structural heart surgery – with thoracotomy or surgery to divide the breastbone
• Systemic lupus erythematosus – with severe complications
• Terminal illness (only on Life or Critical Illness Cover) – where death is expected within 12 months
• Third degree burns – covering 20% of the body’s surface area or 50% loss of surface area of the face
• Ulcerative colitis – treated with total colectomy

**Total permanent disability** – of specified severity

When you choose **Critical Illness Cover** or **Life or Critical Illness Cover**, you can choose to include cover for total permanent disability. This pays out if you become disabled and are no longer able to do certain things. There are different definitions. We’ll tell you which definition applies to you when you take out your plan.

If you choose Enhanced Children’s Critical Illness Cover we will cover your children for the following:

• Cerebral palsy
• Child diabetes mellitus type 1 – requiring permanent insulin injections
• Child intensive care benefit – requiring mechanical ventilation for 7 days
• Craniosynostosis – requiring surgery
• Cystic fibrosis
• Down’s syndrome
• Edwards syndrome
• Hydrocephalus – treated with the insertion of a shunt
• Muscular dystrophy
• Osteogenesis imperfecta
• Patau syndrome
• Spina bifida
• Surgical repair of an atrial or ventricular septal defect
AORTA GRAFT SURGERY
for disease or traumatic injury

Definition
The undergoing of, or inclusion on the NHS waiting list for, surgery for disease or trauma to the aorta with excision and surgical replacement of a portion of the diseased or damaged aorta with a graft. The term aorta includes the thoracic and abdominal aorta but not its branches.

For the above definition, the following is not covered:

- any other surgical procedure, for example the insertion of stents or endovascular repair.

About the condition
The aorta is the main artery that carries blood away from the heart and supplies blood to other arteries in the body. It can become blocked or narrowed when fatty deposits build up on the artery wall. This affects blood supply to the body and is known as disease of the aorta. The aorta can also become weakened by an aneurysm which is a thinning and bulging of the artery wall. This is also classed as disease of the aorta.

When either of these happen surgery can be done to repair or replace the damaged part of the aorta. This is called aorta graft surgery as it involves applying a graft to the damaged part of the aorta wall.

Surgery on the branches of the aorta is not covered because that won't have the major life-changing effect that the surgery of the thoracic and abdominal aorta will have.
APLASTIC ANAEMIA

permanent

Definition
A definite diagnosis by a consultant haematologist of permanent bone marrow failure which results in anaemia, neutropenia and thrombocytopenia requiring treatment with at least one of the following:

• blood transfusion;
• marrow stimulating agents;
• immunosuppressive agents;
• bone marrow transplant.

For the above definition, the following is not covered:

• other forms of anaemia.

About the condition
Aplastic anaemia is a rare and serious illness where the bone marrow fails to produce enough blood cells (red cells, white cells and platelets) for circulation. The lack of blood cells will result in symptoms such as anaemia, an increased risk of infection (neutropenia), bruising and bleeding.

BACTERIAL MENINGITIS
resulting in permanent symptoms

Definition
A definite diagnosis of bacterial meningitis by a consultant neurologist resulting in permanent neurological deficit with persisting clinical symptoms.

For the above definition, the following is not covered:

• all other forms of meningitis other than those caused by bacterial infection.

About the condition
Bacterial meningitis is a serious infection of the fluid surrounding and within the brain. It can be life-threatening and can also cause severe and often permanent physical, mental and nerve damage.

Other forms of meningitis are not covered because the symptoms are usually mild and will clear up within a week or two without specific treatment.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
BENIGN BRAIN OR SPINAL CORD TUMOUR
resulting in permanent symptoms or specified treatment

Definition

A non-malignant tumour or cyst originating from the brain, cranial nerves or meninges within the skull or spinal cord, spinal nerves or meninges, resulting in any of the following:

• permanent neurological deficit with persisting clinical symptoms; or
• undergoing of, or inclusion on the NHS waiting list for, invasive surgery to remove all or part of the tumour; or
• undergoing either stereotactic radiosurgery or chemotherapy treatment to destroy tumour cells.

For the above definition, the following are not covered:

• Tumours in the pituitary gland;
• Tumours originating from bone tissue;
• Cholesteatoma; and
• Angiomas.

About the condition

A tumour is a lump caused by an uncontrolled growth of cells. It can either be malignant (cancerous) or benign (non-cancerous). In the brain or spinal cord, benign tumours can be harmful because they increase pressure in the skull or spinal cord, and this can cause permanent brain and nerve damage.

The pituitary gland is a small, pea-sized gland located at the base of the brain that controls the levels of hormones produced in the body. Lesions or tumours of this gland are more easily treatable than brain tumours and won’t have the same life-changing effect.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
BLINDNESS
permanent and irreversible

Definition
Permanent and irreversible loss of sight to the extent that even when tested with the use of visual aids, vision is measured at 6/60 or worse in the better eye using a Snellen eye chart, or visual field is reduced to 20 degrees or less of an arc, as certified by an ophthalmologist.

About the condition
People can lose their sight in varying degrees in just one, or both eyes. The Snellen eye test usually consists of a number of rows of letters that get smaller as you read down the chart. Vision measured at 6/60 or worse means that you would need to be within 6 metres of the Snellen eye chart to see the top letter whereas someone with normal vision would be able to see the top letter from a distance of 60 metres.

Blindness can be caused by disease, illness or accident.

BRAIN INJURY DUE TO TRAUMA, ANOXIA OR HYPOXIA
resulting in permanent symptoms

Definition
Death of brain tissue due to trauma or reduced oxygen supply (anoxia or hypoxia) resulting in permanent neurological deficit with persisting clinical symptoms.

About the condition
Brain injury due to trauma could be caused by an accident and result in damage to part of the brain. Brain cells are killed and this affects speech, movement and memory. The specific abilities lost or affected depend on where the damage is and the severity of the injury.

Anoxia and hypoxia are two terms to describe oxygen deprivation and its impact on the brain.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
CANCER
excluding less advanced cases

Definition

Any malignant tumour positively diagnosed with histological confirmation and characterised by the uncontrolled growth of malignant cells and invasion of tissue. The term malignant tumour includes:

- leukaemia;
- sarcoma; and
- lymphoma (except cutaneous lymphoma – lymphoma confined to the skin).

For the above definition, the following are not covered:

- all cancers which are histologically classified as any of the following:
  - pre-malignant;
  - non-invasive;
  - cancer in situ;
  - having borderline malignancy; or
  - having low malignant potential;
- malignant melanoma that is confined to the epidermis (outer layer of skin)
- any non-melanoma skin cancer (including cutaneous lymphoma) that has not spread to lymph nodes or metastasised to distant organs
- all tumours of the prostate unless histologically classified as having a Gleason score of 7 or above, or having progressed to at least TNM classification T2bN0M0.

About the condition

Cancer is a disease where cells grow out of control and invade, erode and destroy normal tissue. These cancerous cells can form into clusters known as malignant tumours. Cancer can happen anywhere in the body and there are over 200 different types of cancer. A few cancers don’t actually have cancer in their name (e.g. leukaemia) – but they’re still cancers.

Some cancers are more easily treated than others, for example, early stage prostate cancer and skin cancers that are not invasive. Other cancers which are often easily treated and where the sufferer has a good chance of a full recovery include those that are isolated, not yet malignant and have not yet spread through the body. These cancers are known as cancers in situ, pre-malignant tumours and non-invasive tumours and are often described as having either borderline malignancy or having low malignant potential.
CARDIAC ARREST with insertion of a defibrillator

**Definition**
Sudden loss of heart function with interruption of blood flow around the body resulting in unconsciousness and the undergoing of, or inclusion on the NHS waiting list for, surgery to insert either of the following devices:

- Implantable Cardioverter-Defibrillator (ICD); or
- Cardiac Resynchronisation Therapy with Defibrillator (CRT-D).

The following are not covered:

- insertion of a pacemaker; and
- insertion of a defibrillator without cardiac arrest.

**About the condition**
The heart has an internal electrical system that controls the rhythm of the heartbeat. Cardiac arrest happens when a disturbance in this electrical system causes a disruption in the heartbeat that results in a sudden stop in blood circulation and loss of heart function. This is different from a heart attack, where the heart continues to beat, but blood supply to the heart is blocked causing the death of heart muscle tissue.
**CARDIOMYOPATHY**

of specified severity or undergoing a defined treatment

**Definition**
A definite diagnosis by a consultant cardiologist of cardiomyopathy. The disease must result in at least one of the following:

- left ventricular ejection fraction (LVEF) of 39% or less measured twice at an interval of at least 3 months by an MRI scan,
- marked limitation of physical activities where less than ordinary activity causes fatigue, palpitation, breathlessness or chest pain (Class III or IV of the New York Heart Association classification) over a period of at least 6 months, or
- undergoing of, or inclusion on the NHS waiting list for, implantation of a cardioverter defibrillator (ICD) on the specific advice of a cardiologist for the prevention of sudden cardiac death.

For the above definition the following are not covered:

- all other forms of heart disease, heart enlargement and myocarditis.

**About the condition**
Cardiomyopathy is a disease of the heart muscle that leads to the heart becoming enlarged and functioning poorly. Tests used to assess the presence and severity of cardiomyopathy include:

- An electrocardiograph – measures electric currents associated with the heart contractions.
- An echocardiograph – uses sound waves to produce an image of the heart to view its structure and function.

**CAUDA EQUINA SYNDROME**

with permanent symptoms

**Definition**
A definite diagnosis by an appropriate medical specialist of cauda equina syndrome evidenced by compression of the lumbosacral nerve roots (cauda equina) resulting in all of the following:

- permanent bladder dysfunction;
- permanent weakness and loss of sensation of the legs.

The diagnosis must be supported by appropriate neurological evidence.

**About the condition**
Cauda equina syndrome is a severe type of spinal stenosis where all of the nerves in the lower back are severely compressed. Cauda Equina syndrome can lead to permanent paralysis and incontinence.
CHRONIC LUNG DISEASE
of specified severity

**Definition**
Confirmation by a consultant physician of chronic lung disease resulting in all of the following:

- the need for continuous daily oxygen therapy on a permanent basis;
- FEV1 being less than 40% of normal; and
- vital capacity less than 50% of normal.

**About the condition**
Chronic lung disease can be caused by a number of conditions such as severe chronic bronchitis, emphysema and lung fibrosis. Patients need daily oxygen therapy because of persistent breathlessness at rest or on minimal exertion, requiring daily oxygen therapy.

COMA
with associated permanent symptoms

**Definition**
A state of unconsciousness with no reaction to external stimuli or internal needs with associated permanent neurological deficit with persisting clinical symptoms.

For the above definition, the following are not covered:

- medically induced coma.

**About the condition**
A coma is a state of deep unconsciousness where the person affected can't be woken. A coma can be caused by damage to the brain following an accident or illness. The sufferer may experience permanent nerve damage.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
CORONARY ARTERY BYPASS GRAFTS

**Definition**
The undergoing of, or inclusion on the NHS waiting list for, surgery on the advice of a consultant cardiologist to correct narrowing or blockage of one or more coronary arteries with bypass grafts.

For the above definition, the following are not covered:
- balloon angioplasty;
- atherectomy;
- rotablation;
- insertion of stents; and

**About the condition**
This is a type of heart surgery where the surgery reroutes, or ‘bypasses’, blood around clogged arteries to improve blood flow and oxygen to the heart. If the patient doesn’t have surgery, they’re at real risk of a heart attack. Surgeons take a segment of a healthy blood vessel from another part of the body and make a detour around the blocked or narrowed part of the coronary artery.

CREUTZFELDT-JAKOB DISEASE (CJD) resulting in permanent symptoms

**Definition**
A definite diagnosis of Creutzfeldt-Jakob disease by a consultant neurologist. There must be permanent clinical loss of the ability to do all of the following:
- remember;
- reason; and
- perceive, understand, express and give effect to ideas.

For the above definition, the following are not covered:
- other types of dementia (these are covered under the dementia definition).

**About the condition**
Creutzfeldt-Jakob disease (CJD) is a brain disorder where the health of the brain declines. Sufferers may have failing memory, behavioural changes, lack of co-ordination and visual disturbances. As the illness progresses, brain function seriously worsens and this can cause blindness, involuntary movements, and coma. There’s no treatment to cure or control the disease.
DEAFNESS
permanent and irreversible

Definition
Permanent and irreversible loss of hearing to the extent that the loss is greater than 95 decibels across all frequencies in the better ear using a pure tone audiogram.

About the condition
People can lose their hearing in varying degrees in just one, or both ears. Loss of hearing may be caused by disease, illness or accident. Hearing loss at greater than 95 decibels means that the hearing in your better ear is impaired so that you can only hear sounds louder than 95 decibels even using hearing aids.

DEMENTIA INCLUDING ALZHEIMER’S DISEASE
resulting in permanent symptoms

Definition
A definite diagnosis of dementia including Alzheimer’s disease, by a consultant neurologist, psychiatrist or geriatrician. There must be permanent clinical loss of the ability to do all of the following:

- remember;
- reason; and
- perceive, understand, express and give effect to ideas.

About the condition
Dementia is a term used by doctors to describe a number of different diseases, including Alzheimer’s. All of these diseases affect the brain and cause a progressive loss of memory and mental function that eventually makes it impossible for the affected person to perform even the simplest everyday tasks without help.
ENCEPHALITIS
resulting in permanent symptoms

Definition
A definite diagnosis of encephalitis by a consultant neurologist resulting in permanent neurological deficit with persisting clinical symptoms. For the above definition the following are not covered:

• myalgic encephalomyelitis and chronic fatigue syndrome.

About the condition
Encephalitis is inflammation of the brain. This can happen because of a viral infection or if the immune system stops operating as it should and attacks the tissue of the brain by mistake (post-infectious encephalitis).

Encephalitis often begins with symptoms such as fever and headache. The symptoms soon become more severe and may result in seizures, confusion, drowsiness and loss of consciousness, or a coma.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
HEART ATTACK
of specified severity

Definition

Death of heart muscle, due to inadequate blood supply, that has resulted in all of the following evidence of acute myocardial infarction:

- the characteristic rise of cardiac enzymes or Troponins; and
- new characteristic electrocardiographic changes or other positive findings on diagnostic imaging tests.

The evidence must show a definite acute myocardial infarction.

For the above definition, the following are not covered:

- other acute coronary syndromes; and
- angina without myocardial infarction.

About the condition

Like any muscle in the body the heart needs oxygen from the blood to work properly. The heart is also responsible for pumping blood around the body. A heart attack happens when the blood supply to part of the heart muscle is severely reduced or stopped. The medical term for heart attack is myocardial infarction.

The reduction or stoppage happens when one or more of the arteries supplying blood to the heart muscle is blocked. This is usually caused by the build up of fat-like substances which eventually burst, tear or rupture, creating a ‘snag’ where a blood clot forms and blocks the artery. This leads to a heart attack. If the blood supply is cut off for more than a few minutes, a portion of the heart muscle will suffer permanent injury and die.

An electrocardiograph measures electric currents associated with the heart contractions and these will be altered when someone suffers a heart attack. Blood tests will also show a rise in certain chemicals in the blood, such as troponins and cardiac enzymes following a heart attack.

Angina sufferers experience symptoms similar to a heart attack but part of the heart muscle doesn’t die as a result.
HEART FAILURE
of specified severity

Definition
A definite diagnosis by a consultant cardiologist of failure of the heart to function as a pump. There must be evidence of the following:

- permanent and irreversible limitation of function to at least Class III of the New York Heart Association (NYHA) classification; and
- permanent and irreversible ejection fraction of 39% or less.

About the condition
Heart failure means the heart is unable to pump blood around the body in the way it should. The most common symptoms of heart failure are breathlessness, fatigue or swollen ankles and legs caused by a build up of fluid (oedema).

HEART VALVE REPLACEMENT OR REPAIR

Definition
The undergoing of, or inclusion on the NHS waiting list for, surgery on the advice of a consultant cardiologist to replace or repair one or more heart valves.

About the condition
When the heart pumps blood around the body, valves open and close allowing blood to leave the heart – they also prevent blood flowing back into the heart. There can be 2 main problems with heart valves. One where the valve doesn’t close completely, causing the blood to flow backward instead of forward through the valve, and secondly where the valve opening becomes narrowed limiting the heart’s ability to pump blood to the body.
INTENSIVE CARE
requiring mechanical ventilation for 10 consecutive days

Definition
Any sickness or injury resulting in the person covered requiring continuous mechanical ventilation by means of tracheal intubation for 10 consecutive days (24 hours per day) or more in an intensive care unit in a UK hospital.

For the above definition the following is not covered:

- intensive care requiring mechanical ventilation for a child under the age of 90 days.

KIDNEY FAILURE
requiring permanent dialysis

Definition
Chronic and end stage failure of both kidneys to function, as a result of which regular dialysis is permanently required.

About the condition
The main function of the kidneys is to get rid of the excess fluid and waste products from the body. When both kidneys lose their filtering ability, dangerous levels of fluid and waste build up in the body – a condition known as kidney or renal failure. Kidney failure can happen suddenly after severe injury or slowly because of other illnesses such as diabetes or high blood pressure. In end stage renal disease, the kidneys function at less than 10% of normal capacity and patients need either dialysis or a kidney transplant to stay alive.
LIVER FAILURE
irreversible

Definition
A definite diagnosis, by a consultant physician, of irreversible end stage liver failure due to cirrhosis resulting in all of the following:

- permanent jaundice;
- ascites; and
- encephalopathy.

About the condition
The liver does a number of different functions for the body. It removes or neutralises harmful elements, produces immunity agents to control infection and generally cleans the blood. Cirrhosis happens when scar tissue replaces normal, healthy tissue, blocking the flow of blood through the liver and preventing it from working as it should. Symptoms of end stage liver failure are jaundice, ascites and encephalopathy.

Jaundice is the yellow colour of the skin which appears when the liver fails to clean the blood properly, leaving old red blood cells. Ascites is excess fluid in the space between the lining of the abdomen and abdominal organs (for example, pancreas, stomach, liver). Encephalopathy is a brain disease which happens when blood bypasses the liver. Symptoms include confusion and sleeplessness and may progress to a coma.

LOSS OR REMOVAL OF AN EYEBALL
due to injury or disease

Definition
Loss or permanent surgical removal of an eyeball as a result of injury or disease.

About the condition
An eyeball may be lost or removed as a result of injury or because of a disease or illness.
**LOSS OF HAND OR FOOT**

permanent physical severance

*Definition*
Permanent physical severance of a hand or foot at or above the wrist or ankle joint.

*About the condition*
Hands or feet may be lost as a result of an accident or because of a disease or illness. Permanent physical severance means that the limb can’t be reattached by surgery.

**LOSS OF INDEPENDENT EXISTENCE**

resulting in permanent symptoms

*Definition*
If the claim is for Critical Illness Cover, any condition that:

a) permanently prevents the person covered from doing at least 3 out of the 6 living tasks either with or without the use of mechanical equipment, special devices or other aids and adaptations in use for disabled persons; or

b) causes mental incapacity.

If the claim is for Standard Children’s Critical Illness Cover or Enhanced Children’s Critical Illness Cover, any condition that:

a) permanently prevents the child covered from doing; or permanently prevents the child covered from achieving the ability to do at least 3 out of the 6 living tasks either with or without the use of mechanical equipment, special devices or other aids and adaptations in use for disabled persons; or

b) causes mental incapacity.

The full list of living tasks is on page 42 and the full definition of mental incapacity is on page 43.

*About the condition*
In certain circumstances an accident or illness, not specifically named as one of our critical illness definitions, may leave a person permanently unable to look after him or herself. We measure not being able to look after yourself as physically not being able to do 3 out of the 6 living tasks listed on page 42 or, due to brain disease or injury, mentally not being able to perform tasks you need to survive.
LOSS OF SPEECH
permanent and irreversible

Definition
Total permanent and irreversible loss of the ability to speak as a result of physical injury or disease.

About the condition
Loss of speech may be caused by a disease such as cancer of the larynx, or an accident which damages the vocal chords. Speech lost because of a psychological condition is not covered.

MAJOR ORGAN TRANSPLANT
from another donor

Definition
The undergoing as a recipient of a transplant from another donor of bone marrow or of a complete heart, kidney, liver, lung, or pancreas, or a whole lobe of the lung or liver, or inclusion on an official UK waiting list for such a procedure.

For the above definition, the following is not covered:
- transplant of any other organs, parts of organs, tissues or cells.

About the condition
A number of different illnesses, or an accident, can lead to a major organ failing and it needing to be replaced in whole or in part with a new healthy organ.
**MOTOR NEURONE DISEASE AND SPECIFIED DISEASES OF THE MOTOR NEURONES**

resulting in permanent symptoms

**Definition**

A definite diagnosis of one of the following motor neurone diseases by a consultant neurologist:

- amyotrophic lateral sclerosis (ALS);
- Kennedy’s disease, also known as spinal and bulbar muscular atrophy (SBMA);
- primary lateral sclerosis (PLS);
- progressive bulbar palsy (PBP); or
- progressive muscular atrophy (PMA).

There must also be permanent clinical impairment of motor function.

**About the condition**

Motor neurones are the nerve cells the brain uses to send instructions, in the form of electrical impulses, to the muscles. Motor neurone disease (MND) is the name given to diseases affecting the motor neurones in the brain and spinal cord. The cause of MND is not yet known but the disease causes weakness and wasting of muscles. The disease will become more serious but the rate of deterioration will vary in each case.

**MULTIPLE SCLEROSIS**

with past or present symptoms

**Definition**

A definite diagnosis of multiple sclerosis by a consultant neurologist. There must have been clinical impairment of motor or sensory function, caused by multiple sclerosis.

**About the condition**

Multiple sclerosis (MS) is an incurable disease of the central nervous system. The central nervous system is made up of the brain and the spinal cord which the brain uses as the central message system to the rest of the body. Surrounding and protecting the nerve fibres of the central nervous system is an important substance called myelin. This substance helps messages travel quickly and smoothly from the brain to the rest of the body. MS causes the body’s immune system to attack the myelin surrounding the nerve fibres. This damage to myelin disrupts messages travelling along nerve fibres leading to messages slowing down, becoming distorted, or not getting through at all. Co-ordination, speech, muscle power and sensation are all affected by MS.
NEUROMYELITIS OPTICA (DEVIC’S DISEASE)

**Definition**
A definite diagnosis of neuromyelitis optica by a consultant neurologist. There must be current clinical impairment of motor or sensory function, which must have persisted for a continuous period of at least 3 months.

**About the condition**
Neuromyelitis optica, also known as Devic’s disease, is a disorder in which the body’s immune system attacks the cells in the spinal cord or optic nerves. This may cause a reduction or loss of vision (optic neuritis), and a weakness in the arms and legs, increased sensitivity to touch, cold or heat, and a numbness, tingling or burning sensation (transverse myelitis).

PARALYSIS OF LIMBS
total and irreversible

**Definition**
Total and irreversible loss of muscle function to the whole of a limb.

**About the condition**
Paralysis is the loss of ability to move all or part of the body.

Paralysis can happen as a result of an accident or illness. Neurological evidence that shows permanent paralysis includes a CAT scan of the brain or spine, or X-rays.
PARKINSON PLUS SYNDROMES
resulting in permanent symptoms

Definition
A definite diagnosis by a consultant neurologist or geriatrician of one of the following Parkinson plus syndromes:

- multiple system atrophy;
- progressive supranuclear palsy;
- Parkinsonism-dementia-amyotrophic lateral sclerosis complex;
- corticobasal ganglionic degeneration; or
- diffuse Lewy body disease.

There must also be permanent clinical impairment of at least one of the following:

- motor function;
- eye movement disorder;
- postural instability; or
- dementia.

About the condition
Parkinson plus syndromes refers to a group of neurological conditions similar to Parkinson’s disease, but with their own additional features:

- multiple system atrophy (MSA) causes the nerve cells in the brain to degenerate. This can cause problems with balance, coordination and body movement, and can also affect breathing, heart rate and digestion.
- progressive supranuclear palsy (PSP) causes the progressive death of nerve endings in the brain, causing problems with balance, movement, vision and speech.
- parkinsonism-dementia-amyotrophic lateral sclerosis complex usually appears as a change in personality and behaviour. There may be a lack of emotion, mood swings, restlessness or over activity. At the same time there may also be progression of limb weakness, muscle wasting, shortness of breath or swallowing problems.
- corticobasal ganglionic degeneration will cause many areas of the brain to shrink, which will cause rigid movements, tremor, and problems with balance and coordination.
- diffuse Lewy body disease is a brain disease that causes gradual changes with movement or thinking.
**PARKINSON’S DISEASE**
resulting in permanent symptoms

**Definition**
A definite diagnosis of Parkinson’s disease by a consultant neurologist or geriatrician. There must be permanent clinical impairment of motor function with either associated tremor or muscle rigidity.

For the above definition, the following are not covered:
- Parkinsonian syndromes/Parkinsonism.

**About the condition**
Parkinson’s disease is a brain disorder. It happens when certain nerve cells (neurons) die or become impaired. Normally, these cells produce a vital chemical known as dopamine which allows smooth, coordinated function of the body’s muscles and movement. When about 80% of the dopamine-producing cells are damaged, the symptoms of Parkinson’s disease appear. These include shaking, slowness of movement, stiffness and difficulty with balance. Medicines are available to help ease the symptoms of Parkinson’s but there’s no cure yet.

**PERIPHERAL VASCULAR DISEASE**
with bypass surgery

**Definition**
A definite diagnosis of peripheral vascular disease supported by evidence from an ultrasound of obstruction in the arteries which results in bypass graft surgery to the arteries of the legs.

For the above definition, the following is not covered:
- angioplasty.

**About the condition**
Peripheral vascular disease can be caused by a build-up of fatty deposits in the walls of the leg arteries. The fatty deposits, which are called atheroma, are made up of cholesterol and other waste substances.

The build-up of atheroma on the walls of the arteries makes them narrower and restricts the blood flow to the legs. Symptoms can include a painful ache in the legs when walking. The medical term for this is ‘intermittent claudication’.
PNEUMONECTOMY
removal of a complete lung

Definition
The undergoing of, or inclusion on the NHS waiting list for, surgery on the advice of an appropriate medical specialist to remove an entire lung for disease or traumatic injury suffered by the person covered.

For the above definition the following are not covered:
- removal of a lobe of the lungs (lobectomy);
- lung resection or incision.

About the condition
Pneumonectomy is the medical term used for removing a lung.
A lung is sometimes removed to treat lung cancer when other surgery fails to achieve satisfactory results. This can sometimes happen when a tumour is located near the centre of the lung and affects the pulmonary artery or veins that carry the blood between the heart and lungs. Pneumonectomy may also be used to treat traumatic chest injury that’s caused major damage to the main air passage.

PULMONARY ARTERY GRAFT SURGERY

Definition
The undergoing of, or inclusion on the NHS waiting list for, surgery on the advice of a consultant cardiologist for disease of the pulmonary artery to excise and replace the diseased pulmonary artery with a graft.

About the condition
There are two pulmonary arteries which carry de-oxygenated blood away from the heart to the lungs. If heart disease or trauma interrupts or limits this flow, it may be necessary to graft a bypass so the blood can flow past the blockage.
PULMONARY HYPERTENSION
of specified severity

Definition
A definite diagnosis of pulmonary hypertension by a consultant cardiologist or specialist in respiratory medicine. There must be clinical impairment of heart function resulting in the permanent loss of ability to perform physical activities to at least Class III of the New York Heart Association classification of functional capacity.

About the condition
Pulmonary hypertension is a progressive disorder and is characterised by increased blood pressure affecting arteries in the lungs, known as the pulmonary arteries. The narrowing or obstruction of these very small arteries is known as hypertension.

This can cause shortness of breath and fatigue. Some people with this disorder may experience further symptoms, particularly as the condition worsens. These can include:

- dizziness
- fainting spells
- chest pain
- a racing pulse
- swelling of the ankles or legs.

In severe cases this condition can be life threatening.
SPINAL STROKE
of specified severity

Definition
Death of spinal cord tissue due to inadequate blood supply or haemorrhage within the spinal column resulting in permanent neurological deficit with persisting clinical symptoms.

About the condition
A spinal stroke is a disruption in the blood supply to the spinal cord. The spinal cord depends on a supply of blood to function properly. A disruption in the blood supply causes tissue damage and can block messages (nerve impulses) travelling along the spinal cord.

The blood supply to the spinal cord involves a complex system of blood vessels. The main blood vessels are the anterior spinal artery (at the front of the spinal cord) and the posterior spinal artery (at the back). Spinal strokes are most common in the anterior spinal artery.

Most spinal strokes are caused by blockages (usually blood clots) in the blood supply. These are called ischaemic spinal strokes. Some spinal strokes are caused by bleeds. These are called haemorrhagic spinal strokes.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
STROKE
of specified severity

Definition
Death of brain tissue due to inadequate blood supply or haemorrhage within the skull resulting in all of the following:

- definite evidence of death of tissue or haemorrhage on a brain scan; and
- neurological deficit with persisting clinical symptoms lasting at least 24 hours.

For the above definition, the following is not covered:

- transient ischaemic attack
- death of tissue of the optic nerve or retina/eye stroke.

About the condition
A stroke happens when a blood clot blocks a blood vessel or artery, or when a blood vessel breaks, interrupting blood flow to an area of the brain. When this happens brain cells are killed and this affects speech, movement, and memory. The specific abilities lost or affected depend on where in the brain the stroke takes place and on the size of the stroke. For example, someone who has a small stroke may experience only minor effects such as weakness of an arm or leg, but someone who has a bigger stroke may be left paralysed on one side, lose his or her ability to speak or, in severe cases, die.

Transient ischaemic attacks or mini strokes are not covered as they don’t cause permanent damage. Any loss of vision or balance is temporary and normally lasts for less than 24 hours.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
STRUCTURAL HEART SURGERY
with thoracotomy or surgery to divide the breastbone

Definition
The undergoing of, or inclusion on the NHS waiting list for, surgery requiring thoracotomy or median sternotomy (surgery to divide the breastbone) on the advice of a consultant cardiologist to correct any structural abnormality of the heart.

About the condition
Heart defects come in all types, from minor to major and are often congenital which means they’re present from birth. They can be detected at birth or in childhood but they can also be detected later in life too. A thoracotomy is a surgical incision into the chest wall. A median sternotomy is where the sternum (the breastbone) is cut open to allow access to the heart.

SYSTEMIC LUPUS ERYTHEMATOSUS
with severe complications

Definition
A definite diagnosis of systemic lupus erythematosus by a consultant rheumatologist resulting in either of the following:

- permanent neurological deficit with persisting clinical symptoms; or
- permanent impairment of kidney function with a glomerular filtration rate (GFR) below 30ml/min.

About the condition
The body’s immune system produces white blood cells and proteins called antibodies to destroy viruses and bacteria that are foreign to the body. Lupus, like other auto-immune diseases, mistakes your own tissue as foreign and attacks it causing inflammation. It can affect major organs in the body and stop them functioning properly.

For more information on what we mean by permanent and neurological deficit with persisting clinical symptoms, please see page 43.
TERMINAL ILLNESS
where death is expected within 12 months

Definition
A definite diagnosis by the attending consultant of an illness that satisfies both of the following:

• the illness either has no known cure or has progressed to the point where it cannot be cured; and

• in the opinion of the attending consultant, the illness is expected to lead to death within 12 months.

About the condition
A terminal illness is any illness or condition which, in the opinion of the attending consultant, would lead to death within 12 months.

If we pay a claim and you survive longer than 12 months, you won’t be asked to repay the money.

Terminal illness is included in Life or Critical Illness Cover. It’s not included in Critical Illness Cover.

THIRD DEGREE BURNS
covering 20% of the body’s surface area or 50% loss of surface area of the face

Definition
Burns that involve damage or destruction of the skin to its full depth through to the underlying tissue and covering at least 20% of the body’s surface area or 50% loss of surface area of the face which for the purpose of this definition includes the forehead and ears.

About the condition
A third degree burn is the most serious type, and is also known as a full thickness burn. A third degree burn destroys the outer layer of skin, the epidermis, and the entire layer beneath, the dermis. It may also burn through the muscle and nerves and to the bone. The larger the percentage of the skin that’s burnt, the more life-threatening the condition as burns remove the skin that shields the body from dangerous bacteria.
ULCERATIVE COLITIS

treated with total colectomy

**Definition**
A definite diagnosis of ulcerative colitis confirmed by a consultant gastroenterologist which results in the undergoing of, or inclusion on the NHS waiting list for, surgery to remove the entire colon (large bowel).

**About the condition**
Ulcerative colitis is a condition, where the colon and rectum become inflamed. The colon is the large intestine (bowel), and the rectum is the end of the bowel. Small ulcers can develop on the colon's lining which bleed.

TOTAL PERMANENT DISABILITY

of specified severity

When you choose Critical Illness Cover or Life or Critical Illness Cover, you can choose to include cover for total permanent disability. This pays out if you become disabled and are no longer able to do certain things.

**Definition**
We’ll pay if the person covered is diagnosed as suffering total permanent disability – of specified severity. All diagnoses must:

- be made by a consultant employed at a hospital within the geographical limits shown on page 5 who is a specialist in an area of medicine appropriate to the cause of the claim;
- be the first and unequivocal diagnosis of total permanent disability; and
- be confirmed by our chief medical officer.

A definition of own occupation, working tasks or living tasks will apply to total permanent disability. This is shown on the additional features section of the cover summary and these are explained from pages 40 to 42.

**About the condition**
In certain circumstances an accident or illness, not specifically named as one of our critical illness definitions, may leave a person totally and permanently disabled.

We have 3 definitions of total permanent disability which are own occupation, working tasks and living tasks. The definition that we’ll give a person will be decided taking into account their occupation, leisure activities and health. If the person covered is over age 65 at the time of the claim we’ll apply the living tasks definition.

A separate definition is given for Children’s Critical Illness Cover.
TOTAL PERMANENT DISABILITY FOR CHILDREN’S CRITICAL ILLNESS COVER

If you choose to include Children’s Critical Illness Cover, total permanent disability will be included.

The following is our definition of total permanent disability for Children’s Critical Illness Cover that applies to Standard and Enhanced Children’s Critical Illness Cover.

**Definition**

We’ll pay if the child is diagnosed as suffering total permanent disability for Children’s Critical Illness Cover.

All diagnoses must:

- be made by a consultant employed at a hospital within the geographical limits shown on page 5 who is a specialist in an area of medicine appropriate to the cause of the claim;
- be the first and unequivocal diagnosis of total permanent disability for Children’s Critical Illness Cover; and
- be confirmed by our chief medical officer.

Total permanent disability for Children’s Critical Illness Cover means the child becoming permanently disabled through illness or injury to the extent that for a period of 12 consecutive months the child has been confined to their home, a hospital or similar institution and has required medically supervised constant care and attention.

The disability must be expected to last throughout the child’s life without prospect of improvement.

**About the condition**

In certain circumstances an accident or illness, not specifically named as one of our critical illnesses, may leave a child totally and permanently disabled.
OWN OCCUPATION DEFINITION OF TOTAL PERMANENT DISABILITY

Definition

Becoming permanently disabled according to all of the requirements of either of the following definitions:

1. Total permanent disability – unable before age 65 to do your own occupation ever again.

Loss of the physical or mental ability through an illness or injury before age 65 to the extent that the person covered is unable to do the essential duties of their own occupation ever again. The essential duties are those that are normally required for, and/or form a significant and integral part of, the performance of the person covered’s own occupation that can’t reasonably be omitted or modified.

Own occupation means the trade, profession or type of work the person covered does for profit or pay. It is not a specific job with any particular employer and is irrespective of location and availability.

The appropriate medical specialist must reasonably expect that the disability will last throughout life with no prospect of improvement, irrespective of when the cover ends or the person covered expects to retire.

For the above definition, disabilities for which the appropriate medical specialist can’t give a clear prognosis are not covered.

2. Total permanent disability – mental incapacity.

Irreversible mental incapacity due to an organic brain disease or brain injury supported by evidence of progressive loss of ability to:

- remember;
- reason; and
- perceive, understand, express and give effect to ideas;

which causes a significant reduction in mental and social functioning, requiring the continuous supervision of the person covered.
WORKING TASKS DEFINITION OF TOTAL PERMANENT DISABILITY

Definition

Becoming permanently disabled according to all of the requirements of either of the following definitions:

1. Total permanent disability – unable before age 65 to do 3 specified working tasks ever again.

   Loss of the physical ability through an illness or injury before age 65 to do at least 3 of the 6 working tasks listed below ever again.

   The appropriate medical specialist must reasonably expect that the disability will last throughout life with no prospect of improvement, irrespective of when the cover ends or the person covered expects to retire.

   The person covered must need the help or supervision of another person and be unable to perform the task on their own, even with the use of special equipment routinely available to help and having taken any appropriate prescribed medication.

   The working tasks are:
   - Walking – the ability to walk more than 200 metres on a level surface.
   - Climbing – the ability to climb up a flight of 12 stairs and down again, using the handrail if needed.
   - Lifting – the ability to pick up an object weighing 2kg at table height and hold for 60 seconds before replacing the object on the table.
   - Bending – the ability to bend or kneel to touch the floor and straighten up again.
   - Getting in and out of a car – the ability to get into a standard saloon car, and out again.
   - Writing – the manual dexterity to write legibly using a pen or pencil, or type using a desktop personal computer keyboard.

   For the above definition, disabilities for which the appropriate medical specialist can’t give a clear prognosis are not covered.

2. Total permanent disability – mental incapacity.

   Irreversible mental incapacity due to an organic brain disease or brain injury supported by evidence of progressive loss of ability to:
   - remember;
   - reason; and
   - perceive, understand, express and give effect to ideas;

   which causes a significant reduction in mental and social functioning, requiring the continuous supervision of the person covered.
**LIVING TASKS DEFINITION OF TOTAL PERMANENT DISABILITY**

Becoming permanently disabled according to all of the requirements of either of the following definitions:

**1. Total permanent disability** – unable to look after yourself ever again.

Loss of the physical ability through an illness or injury to do at least 3 of the 6 living tasks listed below ever again.

The appropriate medical specialist must reasonably expect that the disability will last throughout life with no prospect of improvement, irrespective of when the cover ends or the person covered expects to retire.

The person covered must need the help or supervision of another person and be unable to perform the task on their own, even with the use of special equipment routinely available to help and having taken any appropriate prescribed medication.

The living tasks are:

- **Washing** – the ability to wash in the bath or shower (including getting into and out of the bath or shower) or wash satisfactorily by other means.

- **Getting dressed and undressed** – the ability to put on, take off, secure and unfasten all garments and, if needed, any braces, artificial limbs or other surgical appliances.

- **Feeding yourself** – the ability to feed yourself when food has been prepared and made available.

- **Maintaining personal hygiene** – the ability to maintain a satisfactory level of personal hygiene by using the toilet or otherwise managing bowel and bladder function.

- **Getting between rooms** – the ability to get from room to room on a level floor.

- **Getting in and out of bed** – the ability to get out of bed into an upright chair or wheelchair and back again.

For the above definition, disabilities for which the appropriate medical specialist can’t give a clear prognosis are not covered.

**2. Total permanent disability** – mental incapacity.

Irreversible mental incapacity due to an organic brain disease or brain injury supported by evidence of progressive loss of ability to:

- remember;
- reason; and
- perceive, understand, express and give effect to ideas;

which causes a significant reduction in mental and social functioning, requiring the continuous supervision of the person covered.
WHAT WE MEAN BY:

**Permanent**

Expected to last throughout life with no prospect of improvement, irrespective of when the cover ends or the person covered expects to retire.

**Neurological deficit with persisting clinical symptoms**

Dysfunction in the nervous system that is present on clinical examination.

To include:
- numbness
- hyperaesthesia (increased sensitivity)
- paralysis
- localised weakness
- dysarthria (difficulty with speech)
- aphasia (inability to speak)
- dysphagia (difficulty in swallowing)
- visual impairment
- difficulty in walking
- lack of coordination
- tremor
- seizures
- dementia
- delirium
- coma

The following are not covered:
- an abnormality seen on brain or other scans without definite related clinical symptoms.
- neurological signs occurring without symptomatic abnormality, e.g. brisk reflexes without other symptoms.
- symptoms of psychological or psychiatric origin.

**Mental incapacity**

Irreversible mental incapacity due to an organic brain disease or brain injury supported by evidence of progressive loss of ability to:
- remember;
- reason; and
- perceive, understand, express and give effect to ideas; and

which causes a significant reduction in mental and social functioning, requiring the continuous supervision of the person covered.

If the claim is for Standard Children's Critical Illness Cover or Enhanced Children's Critical Illness Cover, irreversible mental incapacity due to an organic brain disease or brain injury supported by evidence of progressive loss of ability to:
- remember;
- reason; and
- perceive, understand, express and give effect to ideas;

which causes a significant reduction in mental and social functioning, requiring the continuous supervision of the child.
ADDITIONAL CONDITIONS WE COVER

If you have Critical Illness Cover or Life or Critical Illness Cover you will also be covered for the following additional conditions:

- Accident hospitalisation – requiring a hospital stay for 28 consecutive days
- Aortic aneurysm – with endovascular repair
- Carcinoma in situ of the breast – with surgery to remove the tumour
- Carcinoma in situ of the cervix uteri – requiring trachelectomy (removal of the cervix) or hysterectomy
- Carcinoma in situ of the colon or rectum – resulting in intestinal resection
- Carcinoma in situ of the larynx – with specified treatment
- Carcinoma in situ of the renal pelvis or ureter – supported by histological evidence
- Carcinoma in situ of the testicle – requiring orchidectomy
- Carcinoma in situ of the urinary bladder – supported by histological evidence
- Carcinoma in situ of the vagina or vulva – resulting in surgery to remove the tumour
- Carcinoma in situ (other) – with surgery
- Carotid artery stenosis – of specified severity resulting in surgery
- Central retinal artery or vein occlusion – resulting in permanent visual loss
- Cerebral or spinal aneurysm – with specified surgery
- Cerebral or spinal arteriovenous malformation – with specified treatment
- Coronary angioplasty – with specified treatment
- Gastrointestinal stromal tumour (GIST) or neuroendocrine tumour (NET) of low malignant potential – with surgery
- Heartbeat abnormalities – with permanent pacemaker insertion
- Low grade prostate cancer – of specified severity
- Ovarian tumour of borderline malignancy/low malignant potential – with surgical removal of an ovary
- Partial loss of sight – permanent and irreversible
- Pituitary gland tumour – with specified treatment
- Skin cancer (not including melanoma) – advanced stage as specified
- Third degree burns – covering at least 10% but less than 25% of the body’s surface area or at least 25% but less than 50% of surface area of the face.
If you meet any of these definitions, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

If you choose to include Enhanced Children’s Critical Illness Cover, we’ll cover certain pregnancy complications as an additional condition (£5,000 per affected pregnancy). See page 65 for what is covered.
ACCIDENT HOSPITALISATION
requiring a hospital stay for 28 consecutive days

Definition
An accident that results in physical injury which requires the person covered to stay in hospital for 28 consecutive days or more on advice of an appropriate medical specialist.

About the condition
You would have to stay in hospital for 28 days in a row as a result of an accident. For example, a car crash.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

AORTIC ANEURYSM
with endovascular repair

Definition
The undergoing of endovascular repair of an aneurysm of the thoracic or abdominal aorta with a graft.

For the above definition, the following is not covered:
• procedures to any branch of the thoracic and abdominal aorta.

About the condition
An aortic aneurysm is a bulge or swelling in the aorta. The aorta is the main blood vessel that runs from the heart down through the chest and abdomen. Endovascular repair is a procedure where a graft is inserted into a blood vessel in the groin through small cuts made in the skin. The graft is then carefully guided up into the aneurysm.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CARCINOMA IN SITU OF THE BREAST

with surgery to remove the tumour

Definition
Carcinoma in situ of the breast positively diagnosed with histological confirmation by biopsy together with the undergoing of surgery to remove the tumour.

About the condition
Carcinoma in situ of the breast means that cancer cells have developed within the breast but have not yet spread to surrounding tissue.

Ductal carcinoma in situ (DCIS) and lobular carcinoma in situ (LCIS) are the most common conditions covered under our definition.

DCIS means that there are cancer cells lining the ducts that would normally carry breast milk to the nipple. This can spread if untreated so is typically treated with surgery.

LCIS means that cells start growing abnormally in the lobules, the milk producing glands at the end of breast ducts. If you have LCIS you are unlikely to need immediate treatment, but you may need regular monitoring to make sure that if a cancer does develop, it will be picked up early.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CARCINOMA IN SITU OF THE CERVIX UTERI
requiring trachelectomy (removal of the cervix) or hysterectomy

Definition
Carcinoma in situ of the cervix uteri diagnosed with histological confirmation by biopsy together with the undergoing of trachelectomy or hysterectomy to remove the tumour.

For the above definition, the following are not covered:
• loop excision, laser surgery, conisation and cryosurgery.

About the condition
Cervical carcinoma in situ is when some of the cells of the cervix have cancerous changes, but these abnormal cells are not invasive as they would be in cancer. Instead they’re all contained within the surface layer of the cervix. As long as the affected area is removed, cancer can be prevented.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CARCINOMA IN SITU OF THE COLON OR RECTUM
resulting in intestinal resection

**Definition**
Carcinoma in situ of the colon or rectum resulting in intestinal resection.

For the above definition, the following are not covered:
- local excision and polypectomy.

**About the condition**
An early stage of colorectal cancer where the disease remains within the lining of the colon or rectum where removal of the cancer, either by polypectomy via colonoscopy or by surgery if the lesion is too large, may be all that is required for treatment.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

CARCINOMA IN SITU OF THE LARYNX
with specified treatment

**Definition**
Carcinoma in situ of the larynx supported by histological confirmation, which has been treated with surgery, laser or radiotherapy.

**About the condition**
Carcinoma in situ of the larynx is a very early cancer contained in the mucosa (top layer of the skin like covering) of the larynx and it has not spread into any surrounding tissue.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CARCINOMA IN SITU OF THE RENAL PELVIS OR URETER

supported by histological evidence

Definition
A definite diagnosis of carcinoma in situ of the renal pelvis or ureter supported by histological confirmation.

About the condition
The ureters are tubes that carry urine from the kidneys to the bladder. The renal pelvis is the part of the kidney that connects to the ureters. Carcinoma in situ of the renal pelvis or ureter means the cancer is growing on the lining (mucosa) of the renal pelvis or ureter but has not invaded through it.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

CARCINOMA IN SITU OF THE TESTICLE

requiring orchidectomy

Definition
A definite diagnosis of carcinoma in situ of the testicle (also known as intratubular germ cell neoplasia unclassified or ITGCNU) or benign testicular tumour supported by histological evidence, which has been treated surgically with an orchidectomy (complete removal of the testicle).

About the condition
Carcinoma in situ (CIS) means that there are abnormal cells in the testicle, but they’re completely contained and so can’t spread, as cancer cells can. Carcinoma in situ of the testicle is not cancer, but if left untreated it could develop into cancer. There’s no lump and usually no other symptoms. CIS is most often found when a man has a testicular biopsy to investigate infertility. The testicle with the CIS is usually removed to prevent a testicular cancer from developing. Benign tumours treated with complete removal of the testicle are also covered by this definition.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CARCINOMA IN SITU OF THE URINARY BLADDER
supported by histological evidence

Definition
A definite diagnosis of carcinoma in situ of the urinary bladder supported by histological evidence.

For the above definition the following are not covered:
- non-invasive papillary carcinoma;
- stage Ta urinary bladder carcinoma;
- all other forms of non-invasive carcinoma.

About the condition
The urinary bladder stores urine collected from the kidneys until it’s disposed of by urination. With carcinoma in situ, cancer cells are only in the very inner layer of the bladder lining, without any invasion into the deeper tissues. If left untreated, the cells could develop into an invasive cancer.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

CARCINOMA IN SITU OF THE VAGINA OR VULVA
resulting in surgery to remove the tumour

Definition
Carcinoma in situ of the vagina or vulva resulting in surgery to remove the tumour.

For the above definition, the following are not covered:
- laser surgery and diathermy; and
- vaginal intraepithelial neoplasia (VAIN) grade 1 or 2 or vulval intraepithelial neoplasia (VIN) grade 1 or 2.

About the condition
An early stage of cancer where abnormal cells are confined to the first layer of cells lining the uterus.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CARCINOMA IN SITU (OTHER)
with surgery

Definition
Carcinoma in situ diagnosed with histological confirmation and characterised by the uncontrolled growth of malignant cells that are confined to the epithelial linings of organs and that has been treated by surgery to remove the tumour.

For the above definition, the following are not covered:

• any skin cancer (including melanoma);
• tumours treated with radiotherapy, laser therapy, cryotherapy or diathermy treatment; and
• intra-epithelial neoplasia or pre-malignant conditions.

This definition excludes the 8 specified carcinoma in situ conditions listed above. For example, if a claim is made for carcinoma in situ of the breast and the definition specific to that condition is not met, the carcinoma in situ (other) definition cannot be used instead.

About the condition
A cancer in situ which is diagnosed with histological confirmation and confined to the epithelial linings of organs and that has been treated by surgery to remove the tumour.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CAROTID ARTERY STENOSIS
of specified severity resulting in surgery

Definition
The undergoing of endarterectomy or angioplasty on the advice of a hospital consultant to treat narrowing of at least 50% of the carotid artery.

About the condition
The carotid arteries are the blood vessels that carry oxygen-rich blood to the head, brain and face. They are located at either side of the neck. Carotid artery stenosis (usually the result of a build-up of plaque) is a narrowing of the carotid arteries which can in turn stop or impair blood flow.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

CENTRAL RETINAL ARTERY OR VEIN OCCLUSION
resulting in permanent visual loss

Definition
Death of the optic nerve or retinal tissue due to inadequate blood supply or haemorrhage within the central retinal artery or vein, resulting in permanent visual impairment of the affected eye.

For this definition, the following are not covered:
• branch retinal artery or vein occlusion or haemorrhage;
• traumatic injury to tissue of the optic nerve or retina.

About the condition
Central retinal vein occlusion is a blockage of the main vein in the retina. The blockage causes the walls of the vein to leak blood and excess fluid into the retina. When this fluid collects in the macula (the area of the retina responsible for central vision), vision becomes blurry.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CEREBRAL OR SPINAL ANEURYSM
with specified surgery

Definition
The undergoing of either of the following surgical procedures:

• surgical correction via craniotomy (surgical opening of the skull) or embolisation treatment using coils or other materials, in order to treat a cerebral aneurysm; or

• surgical resection, wrapping, clipping or embolisation of a spinal aneurysm.

About the condition
An aneurysm is a weakness of an artery wall that creates a bulge or swelling. Because there is a weakening in the artery wall, there is a risk the aneurysm may rupture/burst.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

CEREBRAL OR SPINAL ARTERIOVENOUS MALFORMATION
with specified treatment

Definition
The undergoing of craniotomy, direct spinal surgery, endovascular repair or radiotherapy to treat a cerebral or spinal arteriovenous fistula or malformation.

About the condition
An arteriovenous malformation is a tangle of abnormal and poorly formed blood vessels (arteries and veins). They are at a higher risk of bleeding than normal vessels.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CORONARY ANGIOPLASTY
with specified treatment

Definition
The undergoing of percutaneous coronary intervention (PCI) to correct narrowing or blockages of the left main stem artery, or two or more main coronary arteries. PCI is defined as any therapeutic intra-arterial catheter procedure including balloon angioplasty and stenting.

The surgeries must have been carried out on the advice of a consultant cardiologist. Two coronary angioplasty procedures performed in different arteries at different times is covered.

For the purposes of this definition the main coronary arteries are:

- right coronary artery or its branches;
- left main stem artery or its branches;
- left anterior descending artery or its branches; and
- circumflex artery or its branches.

About the condition
A coronary angioplasty is a procedure used to widen blocked or narrowed coronary arteries (the main blood vessels supplying the heart).

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
GASTROINTESTINAL STROMAL TUMOUR (GIST) OR NEUROENDOCRINE TUMOUR (NET) OF LOW MALIGNANT POTENTIAL WITH SURGERY

Definition
Gastrointestinal stromal tumour (GIST) or neuroendocrine tumour (NET) of low malignant potential diagnosed by histological confirmation and that has been treated by surgery to remove the tumour.

For the above definition, the following are not covered:

- Tumours treated with radiotherapy, laser therapy, cryotherapy or diathermy treatment.

About the condition
GISTs of low malignant potential are a type of sarcoma found in the digestive system. NETs of low malignant potential develop in the cells of the neuroendocrine system and can be found in the gut (usually the appendix), pancreas or lungs.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

HEARTBEAT ABNORMALITIES WITH PERMANENT PACEMAKER INSERTION

Definition
The definite diagnosis of an abnormal rhythm of heartbeat by a consultant cardiologist resulting in the insertion of an artificial pacemaker on a permanent basis.

About the condition
The heart has an electrical system that tells it when to beat and pump blood around the body. If it is not working properly it may cause an abnormal heart rhythm. An abnormal heart rhythm is when the heart beats either too fast, too slow or irregularly. A pacemaker is a small electrical device which is surgically implanted in the chest and sends electrical pulses to the heart to keep it beating regularly.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
LOW GRADE PROSTATE CANCER
of specified severity

Definition

Tumours of the prostate histologically classified as having a Gleason score between 2 and 6 inclusive, provided the tumour has progressed to at least clinical TNM classification T1N0M0.

About the condition

Prostate cancer is one of the most common cancers in men in the UK. The prostate makes and stores a component of semen and is located in the pelvis, under the bladder and in front of the rectum. Prostate cancer forms in the tissues of the prostate. Low grade, early prostate cancer means that cancer cells have been found only in the prostate gland.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
OVARIAN TUMOUR OF BORDERLINE MALIGNANCY/LOW MALIGNANT POTENTIAL
with surgical removal of an ovary

Definition
An ovarian tumour of borderline malignancy/low malignant potential that has been positively diagnosed with histological confirmation and has resulted in surgical removal of an ovary.

For the above definition, the following is not covered:
• removal of an ovary due to cyst.

About the condition
Borderline ovarian tumours are made up of abnormal cells in the ovary, but they’re not true cancers. They’re sometimes called tumours of low malignant potential, because they can sometimes turn into cancers, but most don’t. These tumours grow slowly and most are diagnosed at an early stage, when the abnormal cells are still within the ovary. Abnormal cells can sometimes break away from the tumour and settle elsewhere in the body, usually the abdomen. These don’t usually grow into the underlying tissue.

Borderline ovarian tumours are treated in a different way to ovarian cancers and are usually cured with surgery.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
PARTIAL LOSS OF SIGHT
permanent and irreversible

Definition
Permanent and irreversible loss of sight and visual field, to the extent that even when tested with the use of visual aids, the visual acuity is less than or equal to 0.25 (6/24) in the better eye using a Snellen eye chart and the visual field in the better eye upon testing is reduced to 40 degrees or less of an arc, as certified by an ophthalmologist.

About the condition
People can lose their sight in varying degrees in just one, or both eyes. The Snellen eye test usually consists of a number of rows of letters that get smaller as you read down the chart.

Partial loss of sight can be caused by disease, illness or accident.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.

PITUITARY GLAND TUMOUR
with specified treatment

Definition
Diagnosis of a non-malignant pituitary tumour requiring radiotherapy or surgical removal.

The following is not covered:
- non-malignant tumours of the pituitary gland treated by other methods.

About the condition
The pituitary gland controls growth, development and the functioning of the other endocrine glands. It is the size of a pea and is attached to the base of the brain. A tumour of the pituitary gland causes disfunction of the endocrine system.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
SKIN CANCER (NOT INCLUDING MELANOMA)
advanced stage as specified

Definition
Non-melanoma skin cancer diagnosed with histological confirmation that the tumour is larger than 2 centimetres (cm) across and has at least one of the following features:

- tumour thickness of at least 4 millimetres (mm);
- invasion into subcutaneous tissue (Clark level V);
- invasion into nerves in the skin (perineural invasion);
- poorly differentiated or undifferentiated (cells are very abnormal as demonstrated when seen under a microscope); or
- has recurred at the site of previous treatment.

About the condition
Non-melanoma skin cancer is a group of cancers that slowly develop in the upper layers of the skin.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
THIRD DEGREE BURNS
covering at least 10% but less than 20% of the body’s surface area or at least 25% but less than 50% of surface area of the face

Definition
Burns that involve damage or destruction of the skin to its full depth through to the underlying tissue and covering at least 10% and less than 20% of the body’s surface area, or at least 25% and less than 50% of the surface area of the face which for the purpose of this definition includes the forehead and the ears.

About the condition
A third degree burn is the most serious type, and is also known as a full thickness burn. A third degree burn destroys the outer layer of skin, the epidermis, and the entire layer beneath, the dermis. It may also burn through the muscle and nerves and to the bone. The larger the percentage of the skin that is burnt, the more life-threatening the condition as burns remove the skin that shields the body from dangerous bacteria.

If you meet this definition, we’ll pay out 25% of the amount of cover, up to a maximum of £25,000. And we’ll also pay out the full amount of cover if you later meet one of our critical illness definitions.
CHILDREN’S CRITICAL ILLNESS DEFINITIONS

If you choose Enhanced Children’s Critical Illness Cover your children will be covered for the following child-specific conditions.

CEREBRAL PALSY

**Definition**
A definite diagnosis of cerebral palsy by an appropriate medical specialist.

**About the condition**
Cerebral palsy is a physical impairment that affects movement and co-ordination. It’s caused by a problem with the brain that occurs before, during or soon after birth.

*We will pay out 50% of the Critical Illness Cover, up to £50,000.*

CHILD DIABETES MELLITUS TYPE 1 – REQUIRING PERMANENT INSULIN INJECTIONS

**Definition**
A definite diagnosis of type 1 insulin dependent diabetes mellitus by an appropriate medical specialist. There must be abrupt onset, accompanied by ketonuria or other biochemical evidence of ketosis. Permanent insulin injections must be the only effective treatment to prevent life-threatening diabetic ketoacidosis and these must have continued for a period of at least 12 months.

For the above definition, the following are not covered:

- gestational diabetes unless the child has been on continuous insulin injections to prevent diabetic ketoacidosis for 12 months after delivery of a baby;
- type 2 diabetes mellitus including if treated with oral medications or treated with insulin to improve diabetic control; and
- diabetes insipidus.

**About the condition**
Diabetes is a lifelong condition that causes the blood sugar (glucose) level to become too high. Type 1 diabetes develops when the insulin-producing cells in the body have been destroyed and the body is unable to produce any insulin.

*We will pay out 50% of the Critical Illness Cover, up to £50,000.*
CHILD INTENSIVE CARE BENEFIT
requiring mechanical ventilation for 7 days

Definition
Any sickness or injury resulting in the child requiring continuous mechanical ventilation by means of tracheal intubation for 7 consecutive days (24 hours per day) or more in an intensive care unit in a UK hospital.

For the above definition, the following is not covered:
• intensive care requiring mechanical ventilation for a child under the age of 90 days.

About the condition
This definition covers children aged 90 days and over. It includes sickness or injury but it is essential that the child covered is receiving mechanical help from a ventilator to breathe for a continual period of seven days (for 24 hours a day). An accident or illness of sufficient severity could trigger a claim if the conditions described opposite are met.

We will pay out 50% of the Critical Illness Cover, up to £50,000.

CRANIOSYNOSTOSIS
requiring surgery

Definition
A definite diagnosis of craniosynostosis by a consultant neurosurgeon which has been treated surgically.

About the condition
Craniosynostosis is a condition that causes a baby to be born with, or develop, an abnormally shaped head.

The irregular skull shape can cause a variety of symptoms including persistent headaches, learning difficulties and eye problems.

We will pay out 50% of the Critical Illness Cover, up to £50,000.
CYSTIC FIBROSIS

Definition
A definite diagnosis of cystic fibrosis by an appropriate medical specialist.

About the condition
Cystic fibrosis is an inherited disease affecting the lungs and digestive system which can become clogged with thick, sticky mucus.

It can cause problems with breathing and digestion from a young age. Over time, the lungs become increasingly damaged and may eventually stop working properly.

We will pay out 50% of the Critical Illness Cover, up to £50,000.

DOWN’S SYNDROME

Definition
A definite diagnosis of Down’s syndrome by an appropriate medical specialist.

About the condition
Down’s syndrome is caused by the presence of an extra chromosome in the child's cells. It typically causes some level of learning disability and characteristic physical features.

We will pay out 50% of the Critical Illness Cover, up to £50,000.

EDWARDS SYNDROME

Definition
A definite diagnosis of Edwards syndrome by an appropriate medical specialist.

About the condition
Edwards syndrome is also known as trisomy 18. It is a serious genetic condition caused by an additional copy of chromosome 18 in some or all of the cells in the body. Babies can have a wide range of problems including breathing, heart and kidney problems. They can also have difficulty feeding, resulting in poor growth.

We will pay out 50% of the Critical Illness Cover, up to £50,000.
HYDROCEPHALUS
treated with the insertion of a shunt

**Definition**
A definite diagnosis of hydrocephalus by an appropriate medical specialist which is treated by the insertion of a shunt.

**About the condition**
Hydrocephalus is caused by a build-up of fluid inside the skull. The excess fluid puts pressure on the brain, which can damage it.

*We will pay out 50% of the Critical Illness Cover, up to £50,000.*

MUSCULAR DYSTROPHY

**Definition**
A definite diagnosis of muscular dystrophy made by an appropriate medical specialist.

**About the condition**
Muscular dystrophy is usually an inherited genetic condition which causes progressive weakening and wasting of the muscles.

*We will pay out 50% of the Critical Illness Cover, up to £50,000.*

OSTEOGENESIS IMPERFECTA

**Definition**
A definite diagnosis of osteogenesis imperfecta by an appropriate medical specialist.

For the above definition the following is not covered:
- type 1 osteogenesis imperfecta.

**About the condition**
Osteogenesis Imperfecta (OI) is a genetic condition which causes bones to break easily. The condition can differ from person to person so there is a classification system to describe the different types of OI and is commonly used to help describe how severely a person with OI is affected. Type 1 is the mildest form of OI.

*We will pay out 50% of the Critical Illness Cover, up to £50,000.*
PATAU SYNDROME

Definition
A definite diagnosis of Patau syndrome by an appropriate medical specialist.

About the condition
Patau syndrome is also known as trisomy 13. It is a serious genetic disorder caused by having an additional copy of chromosome 13 in some or all of the body's cells. Babies grow slowly in the womb and have a low birth weight, along with a number of other serious medical problems.

We will pay out 50% of the Critical Illness Cover, up to £50,000.

SPINA BIFIDA

Definition
A definite diagnosis of spina bifida myelomeningocele or rachischisis by a paediatrician.

For the above definition, the following are not covered:
- spina bifida occulta; and
- spina bifida with meningocele.

About the condition
Spina bifida is a fault in the spinal column in which one or more vertebrae (the bones which form the backbone) fail to form properly, leading to defects in the spinal cord and bones of the spine. Our definition covers the most severe form of spina bifida where the baby’s spinal canal remains open allowing the spinal cord and protective membranes around it to push out and form a sac in the baby’s back.

We will pay out 50% of the Critical Illness Cover, up to £50,000.
SURGICAL REPAIR OF AN ATRIAL OR VENTRICULAR SEPTAL DEFECT

Definition
The undergoing of surgery on advice of a consultant cardiologist to close a defect in the interatrial or interventricular septum requiring either thoracotomy or the use of endovascular techniques.

About the condition
An atrial septal defect (ASD) is a hole in the wall between the two upper chambers of the heart. A ventricular septal defect (VSD) is a hole in the wall separating the two lower chambers of the heart. Atrial or Ventricular Septal defects are congenital which means they’re present from birth. They can be detected during pre natal scanning, at birth or in childhood.

We will pay out 50% of the Critical Illness Cover, up to £50,000.
PREGNANCY COMPLICATIONS

If you choose Enhanced Children’s Critical Illness Cover we’ll cover the following pregnancy complications as an additional condition (£5,000 per affected pregnancy).

Disseminated intravascular coagulation (DIC)

Eclampsia (but excluding pre-eclampsia)

Ectopic pregnancy with surgery to remove a fallopian tube

Foetal death in utero after at least 20 weeks gestation

Hydatidiform mole

Neo-natal death
Giving birth to a child of at least 20 weeks gestation that does not survive 14 days

New born intensive care
Giving birth to a child of at least 37 weeks gestation that requires continuous mechanical ventilation by means of tracheal intubation for seven days (24 hours per day) or more in an intensive care unit in a UK hospital, starting between the date the child was born and the age of 90 days.

Placental abruption (but excluding placenta praevia)

Still birth (excluding elective pregnancy termination) after at least 24 weeks gestation.
We’re happy to provide your documents in a different format, such as Braille, large print or audio, just ask us when you get in touch.
All of our printed products are produced on stock which is from FSC® certified forests.

The Royal London Mutual Insurance Society Limited is authorised by the Prudential Regulation Authority and regulated by the Financial Conduct Authority and the Prudential Regulation Authority. The firm is on the Financial Services Register, registration number 117672. It provides life assurance and pensions. Registered in England and Wales, company number 99064. Registered office: 55 Gracechurch Street, London, EC3V 0RL. Royal London Marketing Limited is authorised and regulated by the Financial Conduct Authority and introduces Royal London’s customers to other insurance companies.
